

JSONPATH - a query language for json

Since Postgres95

Research scientist,
Moscow University
CEO PostgreSQL Professional

NOSQL POSTGRES IN SHORT

SQL/JSON — 2020

- Complete SQL/JSON
- Better indexing, syntax

JSONPATH - 2019

- SQL/JSON — 2016
- Functions & operators
- Indexing

JSONB - 2014

- Binary storage
- Nesting objects & arrays
- Indexing

JSON - 2012

- Textual storage
- JSON verification

HSTORE - 2003

- Perl-like hash storage
- No nesting, no arrays
- Indexing

Json in PostgreSQL

(state of Art)

Two JSON data types !!!

Jsonb vs Json

```
SELECT j::json AS json, j::jsonb AS jsonb FROM
(SELECT ' {"cc":0, "aa": 2, "aa":1,"b":1}' AS j) AS foo;
           json              |              jsonb
```

$$\{ "cc":0, "aa": 2, "aa":1, "b":1 \} \mid \{ "b": 1, "aa": 1, "cc": 0 \}$$

- json: textual storage «as is»
- jsonb: binary storage, no need to parse, has index support
- jsonb: no whitespaces, no duplicated keys (last key win)
- jsonb: keys are sorted by (length, key)
- jsonb: a rich set of functions (\df jsonb*)
- jsonb: great performance, thanks to indexes
- JQuery - json query language with GIN indexing support

A painting in a style reminiscent of Vincent van Gogh's 'Olympia' or 'Milkmaid'. It depicts three figures: a woman with long, straight white hair and a striped shirt, a woman with short, wavy brown hair, and a baby. The woman with white hair is looking directly at the viewer. The woman with brown hair is looking down at the baby. The baby is looking up at the woman with brown hair. A speech bubble from the woman with white hair contains the text 'JSONB is GREAT, BUT ...'.

**JSONB is GREAT,
BUT ...**

JSON[B] is a black box for SQL

```
WITH RECURSIVE t(id, value) AS ( SELECT * FROM
js_test
UNION ALL
(
SELECT
t.id,
COALESCE(kv.value, e.value) AS value
FROM
t
LEFT JOIN LATERAL
jsonb_each(
CASE WHEN jsonb_typeof(t.value) =
'object' THEN t.value
ELSE NULL END) kv ON true
LEFT JOIN LATERAL jsonb_array_elements(
CASE WHEN
jsonb_typeof(t.value) = 'array' THEN t.value
ELSE NULL END) e ON true
WHERE
kv.value IS NOT NULL OR e.value IS
NOT NULL
)
)
SELECT
js_test.*
FROM
(SELECT id FROM t WHERE value @> '{"color":
"red"}' GROUP BY id) x
JOIN js_test ON js_test.id = x.id;
```

```
SELECT * FROM js_test;
```

id	value
----	-----
1	[1, "a", true, {"b": "c", "f": false}]
2	{"a": "blue", "t": [{"color": "red", "width": 100}]}
3	[{"color": "red", "width": 100}]
4	{"color": "red", "width": 100}
5	{"a": "blue", "t": [{"color": "red", "width": 100}], "color": "red"}
6	{"a": "blue", "t": [{"color": "blue", "width": 100}], "color": "red"}
7	{"a": "blue", "t": [{"color": "blue", "width": 100}], "color": "red"}
8	{"a": "blue", "t": [{"color": "green", "width": 100}]}
9	{"color": "green", "value": "red", "width": 100}
(9 rows)	

Jsquery (2014)

<https://github.com/postgrespro/jsquery/>

```
SELECT * FROM js_test
WHERE
value @@ '*.color = "red"';
```

A painting of a woman with long blonde hair and a man with red hair, with a child in the foreground. The woman is looking directly at the viewer, while the man is looking down at the child. The child is looking up at the man. The background is dark and moody.

**JSONB and JQuery are
GREAT, BUT ...**

**SQL Standard
now loves JSON !**

OH, REALLY ?

Postgres revolution: embracing relational databases

- NoSQL users attracted by the NoSQL Postgres features

Relative Growth db-engines

18 декабря 2014

SQL/Foundation recognized JSON after 8 years

5	Lexical elements.	181
5.1	<SQL terminal character>.	181
5.2	<token> and <separator>.	185

SQL/JSON in SQL-2016

- SQL/JSON data model
 - *A sequence of SQL/JSON items*, each item can be (recursively) any of:
 - SQL/JSON scalar — non-null value of SQL types: Unicode character string, numeric, Boolean or datetime
 - SQL/JSON *null*, value that is distinct from any value of any SQL type (not the same as NULL)
 - JSON arrays, ordered list of zero or more SQL/JSON items — SQL/JSON *elements*
 - JSON objects — unordered collections of zero or more SQL/JSON *members* (key, SQL/JSON item)
- JSON Path language
 - Describes a <projection> of JSON data to be used by SQL/JSON functions
- SQL/JSON functions (9)
 - Construction functions: values of SQL types to JSON values
 - Query functions: JSON values to SQL types
JSON Path(JSON values) → SQL/JSON types → converted to SQL types

SQL/JSON in PostgreSQL

- SQL/JSON data model
 - **Jsonb is the (practical) subset of SQL/JSON data model ORDERED and UNIQUE KEYS**
- JSON Path language
 - Describes a <projection> of JSON data (to be used by SQL/JSON functions)
 - **Most important part of SQL/JSON - committed to PG12 !**
- SQL/JSON functions
 - Constructor functions: **json[b] construction functions**
 - Query functions: **need some functions/operators with jsonpath support**
- Indexes
 - **Use already existing indexes (built-in, jsquery)**
 - **Add opclasses with jsonpath support**

JSON Path query language

- **JSON Path** expression specify the parts of json. It is an optional path mode 'strict' or 'lax' (default), followed by a *path* or unary/binary expression on *paths*. *Path* is a sequence of path elements, started from path variable, path literal or expression in parentheses and zero or more operators (JSON accessors, filters, and item methods)

```
'lax $.floor[*].apt[*] ? (@.area > 40 && @.area < 90)'
```

- Dot notation used for member access – '\$.a.b.c'
 - \$ - the current context element
 - [*], [0 to LAST] - array access (starts from zero!)
- Filter(s) - '\$.a.b.c ? (@.x > 10)'
 - @ - current context in filter expression
- Item methods - '\$.a.b.c.x.type()'
 - type(), size(), double(), ceiling(), floor(), abs(), keyvalue(), datetime()

Two floors house

How path expression works (1)

```
'$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)'
```

How path expression works (2)

'\$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)'

How path expression works (3)

'\$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)'

How path expression works (4)

'\$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)'

How path expression works (5)

'\$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)'

How path expression works (6)

'\$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)'

How path expression works (summary)

'\$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)'

- 1) \$ - SQL/JSON seq. of length 1, json itself
- 2) .floor — SQL/JSON seq. of length 1, an array floor
- 3) [*] – SQL/JSON seq. of length 2, an array of two objects (2 floors)
- 4) .apt — SQL/JSON seq. of length 2, two arrays of objects (apartments on each floor)
- 5) [*] - SQL/JSON seq. of length 5, extracts five objects (apartments)
- 6) Each apartment filtered by (@.area > 40 && @.area < 90) expression

The result is a sequence of two SQL/JSON items

JSON Path: [lax] vs strict

lax and *strict* modes used to facilitate matching of the (sloppy) document structure and path expression

- Lax: missing keys ignored

```
SELECT jsonb '{"a":1}' @? 'lax $.b ? (@ > 1)';
```

```
?column?
```

```
-----
```

```
f
```

- Strict: missing keys resulted null

```
SELECT jsonb '{"a":1}' @? 'strict $.b ? (@ > 1)';
```

```
?column?
```

```
-----
```

```
(null)
```

JSON Path: [lax] vs strict

- Lax: arrays are unwrapped

```
SELECT jsonb '[1,2,[3,4,5]]' @? 'lax $[*] ? (@ == 5)';
?column?          'lax $      ? (@ == 5)'
```

t

- Strict: requires an exact nesting

```
SELECT jsonb '[1,2,[3,4,5]]' @? 'strict $[*] ? (@[*] == 5)';
?column?
```

t

JSON Path examples 1/3

- JSON Path expression is an optional path mode ``strict` or `lax` (default), followed by a path or unary/binary expression on paths. Path is a sequence of path elements, started from path variable, path literal or expression in parentheses and zero or more operators (JSON accessors, filters, and item methods).

'\$' -- the whole JSON document (context item)

'\$foo' -- variable "foo"

""bar"" -- string literal

'12.345' -- numeric literal

'true' -- boolean literal

'null' -- null

'\$.floor' -- field accessor on \$

'\$.floor[*]' -- the same, followed by wildcard array accessor

JSON Path examples 2/3

- JSON Path expression is an optional path mode ``strict` or `lax` (default), followed by a path or unary/binary expression on paths. Path is a sequence of path elements, started from path variable, path literal or expression in parentheses and zero or more operators (JSON accessors, filters, and item methods).

-- complex path with filters and variables

'\$.floor[*] ? (@.level < \$max_level).apt[*] ? (@.area > \$min_area).no'

-- arithmetic expressions:

'-\$a[*]' -- unary

'\$.a + 3' -- binary

'2 * \$.a - (3 / \$.b + \$x.y)' -- complex expression with variables

JSON Path examples 3/3

- JSON Path expression is an optional path mode ``strict` or `lax` (default), followed by a path or unary/binary expression on paths. Path is a sequence of path elements, started from path variable, path literal or expression in parentheses and zero or more operators (JSON accessors, filters, and item methods).

```
-- parenthesized expression used as starting element of a path,  
-- followed by two item methods ".abs()" and ".ceil()"  
'($ + 1).abs().ceil()'
```

Syntactical errors in `jsonpath` are reported:

```
SELECT '$a. >1'::jsonpath;
```

```
ERROR: bad jsonpath representation at character 8
```

```
DETAIL: syntax error, unexpected GREATER_P at or near ">"
```

JSON Path filter expression

- A filter expression is similar to a `WHERE` clause in SQL, it is used to remove SQL/JSON items from an SQL/JSON sequence if they do not satisfy a predicate.
- Syntax: ? (JSON path predicate)
- Result: True, False, Unknown
- Filter works as follows:
 - 1) In lax mode, any SQL/JSON arrays in the operand are unwrapped
 - 2) The predicate is evaluated for each SQL/JSON item in the SQL/JSON sequence
 - 3) The result is those SQL/JSON items for which the predicate resulted in True.
- The special variable @ in filter is a reference to the current SQL/JSON item in the SQL/JSON sequence. The value of @ is the current SQL/JSON item of the first operand of the innermost filter with @.

JSON Path filter expression

- Predicates:
 - *exists*, test if a path expression has a non-empty result
 - Comparison predicates `==`, `!=`, `<>`, `<`, `<=`, `>`, and `>=`
 - *like_regex* for string pattern matching.
Optional *flag* can be combination of `i`, `s` (default), `m`, `x`.
 - *starts with* to test for an initial substring (prefix).
 - *is unknown* to test for *Unknown* results. Its operand should be in parentheses.

JSON Path filters

- Arithmetic errors in filters suppressed:

-- behaviour required by standard

```
SELECT jsonb_path_query(' [1,0,2]', '$[*] ? (1 / @ >= 1)');
```

```
jsonb_path_query
```

```
-----
```

```
1
```

```
(1 row)
```

JSON Path methods

- Predefined methods attached to JSON Path expression

```
SELECT jsonb_path_query(jsonb '{"a":5, "b":2}', '$ ? (@.a > 1).keyvalue()')
FROM house;
```

```
      jsonb_path_query
```

```
-----
{"id": 0, "key": "a", "value": 5}
{"id": 0, "key": "b", "value": 2}
(2 rows)
```

- Methods can be combined

```
SELECT jsonb_path_query(jsonb '{"a":5, "b":2}', '$ ? (@.a > 1).keyvalue().key')
FROM house;
```

```
      jsonb_path_query
```

```
-----
"a"
"b"
(2 rows)
```

JSON Path implementation in Postgres

Standard permits only string literals in JSON Path specification.

- JSON Path in Postgres implemented as **jsonpath** data type - the binary representation of parsed SQL/JSON path expression.
- To accelerate JSON Path queries using **existing** indexes for jsonb we need boolean operators for json[b] and jsonpath.
- Implementation as a type is much easier than integration of JSON path processing with executor (complication of grammar and executor).
- In simple cases, expressions with operators can be more concise than with SQL/JSON functions.
- It is Postgres way to use operators with custom query types (tsquery for FTS, lquery for ltree, jsquery for jsonb,...)

jsonpath functions

- **jsonb_path_exists()** => boolean
Test whether a JSON path expression returns any SQL/JSON items (operator @?).
- **jsonb_path_match()** => boolean
Evaluate JSON path predicate (operator @@).
- **jsonb_path_query()** => setof jsonb
Extract a sequence of SQL/JSON items from a JSON value.
- **jsonb_path_query_array()** => jsonb
Extract a sequence of SQL/JSON items wrapped into JSON array.
- **jsonb_path_query_first()** => jsonb
Extract the first SQL/JSON item from a JSON value.

Jsonpath functions

- All `jsonb_path_xxx( )` functions have the same signature:

```
jsonb_path_xxx(  
    js jsonb,  
    jsp jsonpath,  
    vars jsonb DEFAULT '{}',  
    silent boolean DEFAULT false  
)
```

- "vars" is a jsonb object used for passing jsonpath variables:

```
SELECT jsonb_path_query_array('[1,2,3,4,5]', '$[*] ? (@ > $x)',  
                               vars => '{"x": 2}');
```

```
jsonb_path_query_array  
-----  
[3, 4, 5]
```

Jsonpath functions

- "silent" flag enables suppression of errors:

```
SELECT jsonb_path_query('[]', 'strict $.a');  
ERROR:  SQL/JSON member not found  
DETAIL:  jsonpath member accessor can only be applied to an object
```

```
SELECT jsonb_path_query('[]', 'strict $.a', silent => true);  
 jsonb_path_query  
-----  
(0 rows)
```

Jsonpath functions: Examples

- `jsonb_path_exists('{"a": 1}', '$.a')` => true
`jsonb_path_exists('{"a": 1}', '$.b')` => false
- `jsonb_path_match('{"a": 1}', '$.a == 1')` => true
`jsonb_path_match('{"a": 1}', '$.a >= 2')` => false
- `jsonb_path_query('{"a": [1, 2, 3, 4, 5]}',
 '$a[*] ? (@ > 2)')` => 3, 4, 5 (3 rows)

`jsonb_path_query('{"a": [1, 2, 3, 4, 5]}',
 '$a[*] ? (@ > 5)')` => (0 rows)

Jsonpath functions: Examples

- `jsonb_path_query_array('{"a": [1, 2, 3, 4, 5]}',
'$a[*] ? (@ > 2)')` => `[3, 4, 5]`

`jsonb_path_query_array('{"a": [1, 2, 3, 4, 5]}',
'$a[*] ? (@ > 5)')` => `[]`

- `jsonb_path_query_first('{"a": [1, 2, 3, 4, 5]}',
'$a[*] ? (@ > 2)')` => `3`

`jsonb_path_query_first('{"a": [1, 2, 3, 4, 5]}',
'$a[*] ? (@ > 5)')` => `NULL`

Jsonpath: boolean operators for jsonb

- `jsonb @? jsonpath (exists)`

Test whether a JSON path expression returns any SQL/JSON items.

```
jsonb '[1,2,3]' @? '$[*] ? (@ == 3)' => true
```

- `jsonb @@ jsonpath (match)`

Get the result of a JSON path predicate.

```
jsonb '[1,2,3]' @@ '$[*] == 3' => true
```

- These operators are interchangeable:

```
js @? '$.a' <=> js @@ 'exists($.a)'
```

```
js @@ '$.a == 1' <=> js @? '$ ? ($.a == 1)'
```

\$.floor[0,1].apt[1 to last]

\$.floor[0, 1].apt[1 to last]

- PG12 (jsonpath) query

```
SELECT jsonb_path_query_array(js, '$.floor[0, 1].apt[1 to last]')  
FROM house;
```

- PG11 query

```
SELECT jsonb_agg(apt)  
FROM (SELECT apt->generate_series(1, jsonb_array_length(apt) - 1)  
FROM (SELECT js->'floor'->unnest(array[0, 1])->'apt'  
FROM house) apts(apt)) apts(apt);
```

`$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)`

`$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)`

`$.floor[*].apt[*] ? (@.area > 40 && @.area < 90)`

- PG12 (jsonpath) query

```
SELECT jsonb_path_query(js, '$.floor[*].apt[*] ?  
                           (@.area > 40 && @.area < 90)')  
FROM house;
```

- PG11 query

```
SELECT apt  
FROM (SELECT jsonb_array_elements(jsonb_array_elements(js->'floor')->'apt')  
      FROM house) apts(apt)  
WHERE (apt->>'area')::int > 40 AND (apt->>'area')::int < 90;
```

Extension: \$.** ? (@ == "Moscow")

\$.** ? (@ == "Moscow")

Extension: \$.** ? (@ == "Moscow")

- PG12 (jsonpath wildcard) query

```
SELECT jsonb_path_exists(js, '$.** ? (@ == "Moscow")') FROM house;  
SELECT jsonb_path_exists(js, '$.**{0 to last} ? (@ == "Moscow")') FROM house;
```

- JSQUERY query

<https://github.com/postgrespro/jsquery>

```
SELECT  
js @@ '* = "Moscow"'::jsquery  
FROM house.
```

Extension: \$.** ? (@ == "Moscow")

- PG11 query

```
WITH RECURSIVE t(value) AS
  (SELECT * FROM house
   UNION ALL
   ( SELECT
       COALESCE(kv.value, e.value) AS value
     FROM
       t
     LEFT JOIN LATERAL jsonb_each(
       CASE WHEN jsonb_typeof(t.value) = 'object' THEN t.value ELSE NULL END
     ) kv ON true
     LEFT JOIN LATERAL jsonb_array_elements(
       CASE WHEN jsonb_typeof(t.value) = 'array' THEN t.value ELSE NULL END
     ) e ON true
     WHERE
       kv.value IS NOT NULL OR e.value IS NOT NULL)
  )
SELECT EXISTS (SELECT 1 FROM t WHERE value = '"Moscow"');
```

JSON Path in PG12: one missing feature

- `.datetime( )` item method (T832) not supported in PG12:

-- behavior required by standard

```
SELECT jsonb_path_query( '"13.03.2019"',  
'$.datetime("DD.MM.YYYY")' );
```

```
jsonb_path_query
```

```
-----
```

```
"2019-03-13"
```

```
(1 row)
```

-- behavior of PG12

```
SELECT jsonb_path_query( '"13.03.2019"',  
'$.datetime("DD.MM.YYYY")' );
```

```
ERROR:  bad jsonpath representation
```

- <https://commitfest.postgresql.org/23/2133/>

SQL/JSON standard conformance

SQL/JSON feature	PostgreSQL 12	Oracle 18c	MySQL 8.0.4	SQL Server 2017
JSON PATH: 15	14/15	11/15	5/15	2/15

PostgreSQL 12 has **the best implementation** of JSON Path

More information about Jsonpath

<https://github.com/obartunov/sqljsondoc/blob/master/jsonpath.md>

Gentle Guide to JSONPATH in PostgreSQL

This document describes SQL/JSON implementation as committed to PostgreSQL 12, which consists of implementation of JSON Path - the JSON query language, and several functions and operators, which use the path language to work with jsonb data. Consider this document as a tutorial , the reference guide is available as a part of official PostgreSQL documentation for release 12.

Authors: Oleg Bartunov and Nikita Glukhov.

Introduction to SQL/JSON

SQL-2016 standard doesn't describes the JSON data type, but instead it introduced SQL/JSON data model (not JSON data type like XML) with string storage and path language used by certain SQL/JSON functions to query JSON.

SQL/JSON data model is a sequences of items, each of which is consists of SQL scalar values with an additional SQL/JSON null value, and composite data structures using JSON arrays and objects.

JSONB indexing: built-in opclasses

Sample jsonb: {"k1": "v1", "k2": ["v2", "v3"]}

- **jsonb_ops** (default GIN opclass for jsonb) extracts keys and values
 - "k1", "k2", "v1", "v2", "v3"
 - Supports top-level key-exists operators ?, ?& and ?| , contains @> operator
 - Overlapping of large postings might be slow
- **jsonb_hash_ops** extracts hashes of paths:
 - hash("k1"."v1"), hash("k2".#."v2"), hash("k2".#."v3")
 - Supports only contains @> operator
 - Much faster and smaller than default opclass (for @>)

JSONB indexing: Jsquery extension

- jsonb_path_value_ops
 - (hash(full_path);value)
 - exact and range queries on values, exact path searches
- jsonb_laxpath_value_ops (branch sqljson)
 - The same as above, but array path items are ignored, which greatly simplifies extraction of ***lax*** JSON path queries.
- jsonb_value_path_ops
 - (value; bloom(path_1) | bloom(path_2) | ... bloom(path_N))
 - Exact value search and wildcard path queries.
- Also, jsquery provides debugging and query optimizer with hints.

Jsonpath queries could use existing jsonb indexes

- Find all authors with the same bookmarks as the given author

```
CREATE index ON bookmarks USING gin(jb jsonb_path_ops );
```

```
SELECT
  b1.jb->'author'
FROM
  bookmarks b1,
  bookmarks b2
WHERE
  b1.jb @@ format('$.title == %s && $.author != %s', b2.jb -> 'title', b2.jb -> 'author')::jsonpath
AND b2.jb @@ '$.author == "ant.on"'::jsonpath;
```

Seq scan: 35000 ms, Index scan: 6 ms

Jsonpath performance (simple queries)

- Test table with 3 mln rows

```
CREATE TABLE t AS
SELECT jsonb_build_object('x', jsonb_build_object('y', jsonb_build_object('z', i::text)))
FROM generate_series(1, 3000000) i;
```

```
SELECT * from t where jsonb_path_query_first(js, '$.x.y.z') = '"123"';
                        js
```

```
-----
{"x": {"y": {"z": "123"}}}
(1 row)
```

Jsonpath performance (simple queries)

- Performance of arrow operators is slightly better for simple queries, but jsonpath allows more complex queries (see intra joins example).

query	time, ms	
jsonb_path_query_first(js, '\$.x.y.z') = '"123"'	1700	
js->'x'->'y'->'z' = '"123"'	1700	
jsonb_path_query_first(js, '\$.x.y.z')->>0 = '123'	600	
js->'x'->'y'->>'z' = '123'	430	
jsonb_path_exists(js, '\$? (\$.x.y.z == "123")')	1000	
jsonb_path_match(js, '\$.x.y.z == "123"')	1000	
jsonb_path_match(js, '\$.x.y.z == \$x', '{"x": "123"}')	1100	
jsonb_path_match(js, '\$.x.y.z == \$x', jsonb_object(array['x'], array['123']))	1100	immutable
jsonb_path_match(js, '\$.x.y.z == \$x', jsonb_build_object('x', '123'))	2800	stable
jsonb_extract_path(js, 'x', 'y', 'z') = '"123"'	1670	
jsonb_extract_path_text(js, 'x', 'y', 'z') = '123'	580	

Jsonpath intra joins (joining parts of the same column)

Query: find all the actors && editors in **the same movie** (43808 out of 6378007 rows in names). Actress && editors — 7173.

- **Jsonpath:**

```
SELECT jb->'id' FROM names
WHERE jb @@ '$.roles[*] ? (@.role == "actor").title ==
           $.roles[*] ? (@.role == "editor").title'::jsonpath;
```

Sequential Scan: **29748.223 ms**
Sequential Scan (parallel): **4678.925 ms**
Bitmap Index Scan (jsquery index): **2328.880 ms**

- «Old» way:

```
SELECT jb->'id' FROM names WHERE
jb @> '{"roles": [{"role": "actor"}, {"role": "editor"}]}' AND
(SELECT array_agg(r->>'title') FROM jsonb_array_elements(jb->'roles') roles(r)
 WHERE r->>'role' = 'actor') &&
(SELECT array_agg(r->>'title') FROM jsonb_array_elements(jb->'roles') roles(r)
 WHERE r->>'role' = 'editor');
```

Sequential scan: **20233.032 ms**
Bitmap Index Scan: **3860.534 ms**

```
"id": ....
"roles": [
    {
      "role": "actor",
      "title": ....
    }
    ...
  ]
```

Jsonpath intra joins (joining parts of the same column)

Jsonpath version is the fastest, since it has its own executor, no overheads.

- **Jsonpath:**

Sequential Scan:	29748.223 ms
Sequential Scan (parallel):	4678.925 ms
Bitmap Index Scan (jsquery index):	2328.880 ms

- **Arrow (old way):**

Sequential scan:	20233.032 ms
Bitmap Index Scan:	3860.534 ms

- **Relational way:**

Sequential Scan:	34840.434 ms
Sequential Scan (parallel,6):	4233.829 ms
Bitmap Index Scan:	13745.517 ms
Bitmap Index Scan(parallel,6):	3807.380 ms

- **Mongo:** **3808 ms**

```
"id": ....  
"roles": [  
    {  
        "role": "actor",  
        "title": ....  
    }  
    ...  
    }  
]
```

Roadmap (see Addendums)

- PG13: SQL/JSON functions from SQL-2016 standard
- PG13: datetime support in JSON Path (complete T832)
- PG13: Planner support functions
- PG13: Parameters for opclasses - jsonpath to specify parts of jsonb to index
- PG13: Jsquery GIN opclasses to core
- PG13: Extend jsonpath syntax
 - array,object,sequence construction
 - object subscripting, lambda expressions
 - user-defined item methods and functions
- COPY with support of jsonpath
- Make one JSON data type !

A painting of a woman with long blonde hair and a man with red hair, with a child in the foreground. The woman is looking directly at the viewer, while the man is looking down at the child. The child is looking up at the man. The background is dark and abstract.

**NoSQL Postgres
rulezz !**

Good Roadmap !

Who need Mongo ?

Summary

- PostgreSQL is already good NoSQL database
 - Great roadmap
- SQL/JSON provides better flexibility and interoperability
 - JSON Path implementation (PG12) is the best !
- Jsonpath is superior for complex queries (thanks to internal executor)

Move from NoSQL to Postgres !

NOSQL POSTGRES IS A COMMUNITY PROJECT

ALL

YOU

POSTGRES

NEED

IS

ADDENDUM I

SQL/JSON FUNCTIONS

SQL/JSON FUNCTIONS

- The SQL/JSON **construction** functions (json[b]_xxx() functions):
 - JSON_OBJECT - construct a JSON[b] object.
 - json[b]_build_object()
 - JSON_ARRAY - construct a JSON[b] array.
 - json[b]_build_array()
 - JSON_ARRAYAGG - aggregates values as JSON[b] array.
 - json[b]_agg()
 - JSON_OBJECTAGG - aggregates name/value pairs as JSON[b] object.
 - json[b]_object_agg()

SQL/JSON in PostgreSQL

- The SQL/JSON **retrieval** functions:
 - JSON_VALUE - Extract an SQL value of a predefined type from a JSON value.
 - JSON_QUERY - Extract a JSON text from a JSON text using an SQL/JSON path expression.
 - JSON_TABLE - Query a JSON text and present it as a relational table.
 - IS [NOT] JSON - test whether a string value is a JSON text.
 - JSON_EXISTS - test whether a JSON path expression returns any SQL/JSON items

JSON_TABLE — relational view of json

- Table with rooms from json

```
SELECT apt.*  
FROM
```

```
  house,
```

```
  JSON_TABLE(js, '$.floor[0, 1]' COLUMNS (
```

```
    level int,
```

```
    NESTED PATH '$.apt[1 to last]' COLUMNS (
```

```
      no int,
```

```
      area int,
```

```
      rooms int
```

```
    )
```

```
  )) apt;
```

level	no	area	num_rooms
1	1	40	1
1	2	80	3
1	3	50	2
2	4	100	3
2	5	60	2

(5 rows)

ADDENDUM II

Parameters for Opclasses

Parameters for opclasses

Operator class is a «glue» or named collection of:

- AM (access method)
- Set of operators
- AM specific support function

Examples:

- CREATE INDEX .. USING btree (textcolumn **text_pattern_ops**)
- CREATE INDEX .. USING gin (jsoncolumn **jsonb_ops**)
- CREATE INDEX .. USING gin (jsoncolumn **jsonb_path_ops**)

Extending Indexing infrastructure

- Opclasses have «hardcoded» constants (signature size)
 - Let user to define these constants for specific data
- Indexing of non-atomic data (arrays, json[b], tsvector,...)
 - Specify what part of column to index — partial index only filters rows
- Use different algorithms to index
 - Specify what to use depending on data

Parameters for opclasses: syntax

- Parenthized parameters added after column's opclass. Default opclass can be specified with **DEFAULT** keyword:

```
CREATE INDEX idx ON tab USING am (  
    {expr {DEFAULT | opclass} ({name=value} [,...])} [,...]  
) ...
```

```
CREATE INDEX ON small_arrays USING gist (  
    arr gist__intbig_ops(siglen=32),  
    arr DEFAULT (num_ranges = 100)  
);  
CREATE INDEX bookmarks_selective_idx ON bookmarks USING  
    gin(js jsonb_ops(projection='strict $.tags[*].term'));
```

ADDENDUM III

Planner support for jsonpath

Planner support function for jsonpath functions

- PG12+: API for planner support functions that lets them create derived index conditions for their functions.

```
CREATE [OR REPLACE] FUNCTION
    name ([[argmode] [argname] argtype [{DEFAULT|=} default_expr] [,...]])
{
    .....
    | SUPPORT support_function
    .....
} ...
```

- `jsonb_path_match()` transforms to *jsonb @@ jsonpath* (uses index !)

Planner support function for jsonpath functions

- PG12+: API for planner support functions that lets them create derived index conditions for their functions.

```
SELECT * FROM t t1, t t2 WHERE  
jsonb_path_match(t1.js, '$.a == $a', vars => t2.js, silent => true);  
QUERY PLAN
```

```
-----  
Nested Loop  
  -> Seq Scan on t t2  
  -> Bitmap Heap Scan n t t1  
      Filter: jsonb_path_match(js, '($. "a" == $"a")'::jsonpath,  
t2.js, true)  
      -> Bitmap Index Scan on t_js_idx  
          Index Cond: (js @@ jsonpath_embed_vars('($. "a" ==  
$"a")'::jsonpath, t2.js))  
(6 rows)
```

Planner support function for jsonpath functions

- PG12+: API for planner support functions that lets them create derived index conditions for their functions.

```
jsonb_path_match(b1.jb,  
                 '$.title == $title && $.author != $author',  
                 vars => b2.jb)  
AND b2.jb ->> 'author' = 'ant.on'
```

=>

```
b1.jb @@ jsonpath_embed_vars('$title == $title &&  
                             $.author != $author', b2.jb)  
AND b2.jb @@ '$.author == "ant.on"'::jsonpath
```

ADDENDUM IV

Jsonpath syntax extensions

Jsonpath syntax extensions

- Array construction syntax:

```
SELECT jsonb_path_query(' [1,2,3]', '[0, $[*], 4]');  
[0, 1, 2, 3, 4]
```

- Object construction syntax:

```
SELECT jsonb_path_query(' [1,2,3]', '{a: $, "s": $.size()}');  
{"a": [1, 2, 3], "s": 3}
```

- Sequence construction syntax:

```
SELECT jsonb_path_query(' [1,2,3]', '0, $[*], 4');
```

```
0  
1  
2  
3  
4
```

Jsonpath syntax extensions

- Object subscripting:

```
SELECT jsonb_path_query('{"a": 1}', '$["a"]');  
1
```

```
SELECT jsonb_path_query('{"a": 1, "b": "ccc"}', '$["a","b"]');  
1  
"ccc"
```

```
SELECT jsonb_path_query('{"a": 1}', 'lax $["a", "b"]');  
1
```

```
SELECT jsonb_path_query('{"a": 1}', 'strict $["a", "b"]');  
ERROR:  JSON object does not contain key "b"
```

Jsonpath syntax extensions

- Array item methods with lambda expressions (ECMAScript 6 style):

```
SELECT jsonb_path_query(' [1,2,3]', '$.map(x => x + 10)');  
[11, 12, 13]
```

```
SELECT jsonb_path_query(' [1,2,3]', '$.reduce((x,y) => x + y)');  
6
```

```
SELECT jsonb_path_query(' [1,2,3]', '$.fold((x,y) => x + y, 10)');  
16
```

```
SELECT jsonb_path_query(' [1,2,3]', '$.max()');  
3
```

- Alternative syntax for lambdas: '\$.fold(\$1 + \$2, 10)'

Jsonpath syntax extensions

- Sequence functions with lambda expressions:

```
SELECT jsonb_path_query('[1,2,3]', 'map($[*], x => x + 10)');  
11  
12  
13    -- sequence is returned, not array
```

```
SELECT jsonb_path_query('[1,2,3]', 'reduce($[*], (x,y) => x+y)');  
6
```

```
SELECT jsonb_path_query('[1,2,3]', 'fold($[*], (x,y)=>x+y, 10)');  
16
```

```
SELECT jsonb_path_query('[1,2,3]', 'max($[*])');  
3
```

Jsonpath syntax extensions

- User-defined item methods and functions (contrib/jsonpathx):

```
CREATE FUNCTION map(jsonpath_fcxt) RETURNS int8
AS 'MODULE_PATHNAME', 'jsonpath_map' LANGUAGE C;
```

```
typedef struct JsonPathFuncContext
{
    JsonPathExecContext *cxt;
    JsonValueList *result;
    const char *funcname;
    JsonItem *jb; /* @ */
    JsonItem *item; /* NULL => func, non-NULL => method */
    JsonPathItem *args;
    void **argscache;
    int nargs;
} JsonPathFuncContext;
```

ADDENDUM V

Performance of Intra joins

Jsonpath intra joins (joining parts of the same column)

3808 ms

```
db.names.find({
  "roles.role": { $all: [ "actor", "editor" ] }, // find by index on "roles.role"
  $expr: {
    $setIntersection: [
      { $map: { // '$.roles[*] ? (@.role == "actor").title'
        input: {
          $filter: { // '$.roles[*] ? (@.role == "actor")'
            input: "$roles",
            as: "r1",
            cond: { $eq: ["$$r1.role", "actor"] }
          }
        },
        as: "t1",
        in: "$$t1.title"
      },
      { $map: { // '$.roles[*] ? (@.role == "editor").title'
        input: {
          $filter: { // '$.roles[*] ? (@.role == "editor")'
            input: "$roles",
            as: "r2",
            cond: { $eq: ["$$r2.role", "editor"] }
          }
        },
        as: "t2",
        in: "$$t2.title"
      }
    ]
  }
}).explain("executionStats").executionStats.executionTimeMillis
```

Jsonpath intra joins (joining parts of the same column)

- Query: find all the actors who were editors in **the same movie** (6378007 rows in names).
- Relational analogue of names table:

```
CREATE TABLE roles AS
SELECT
  id,
  r->>'role' AS "role",
  r->>'title' AS "title",
  r->>'character' AS "character",
  r->'ranks' AS "ranks"
FROM
  names,
  jsonb_array_elements(jb->'roles') roles(r);
```

```
CREATE INDEX ON roles(role);
CREATE INDEX ON roles (id, title, role); -- composite btree index
```

\d+

public		names		table		3750 MB
public		roles		table		5830 MB

\di+

public		names_jb_idx		index		names		1439 MB
public		roles_id_title_role_idx		index		roles		4710 MB

Jsonpath intra joins (joining parts of the same column)

- Query: find all the actors who were editors in **the same movie** (6378007 rows in names).
- Relational analogue of names table:

```
SELECT DISTINCT r1.id
FROM roles r1
WHERE r1.role = 'editor' AND EXISTS (
    SELECT FROM roles r2 WHERE r2.id = r1.id AND r2.title = r1.title AND r2.role = 'actor'
);
```

Sequential Scan:	34840.434 ms
Sequential Scan (parallel,6):	4233.829 ms
Bitmap Index Scan:	13745.517 ms
Bitmap Index Scan(parallel,6):	3807.380 ms
